

PROCEDURE TO PERFORM A TOMATO TRANSPLANT TEST

1

Transplant 5 to 10 succulent, fast-growing tomato seedlings into disinfected beds approximately 4 to 6 in. deep. If there is variation in the field, plant into the heaviest, wettest soil.

2

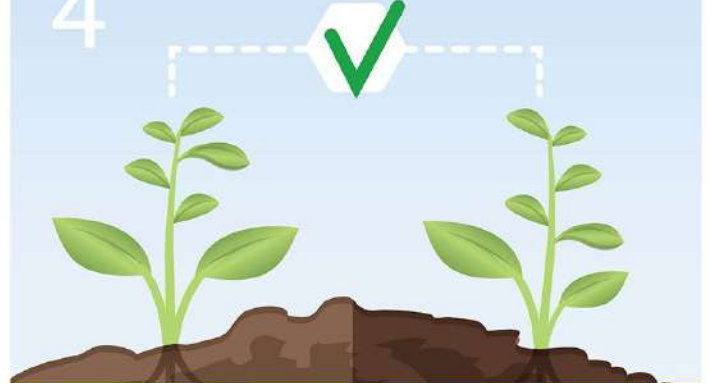

Do the same in a non-disinfected area.

3

Inspect the seedlings in 2 days for wilting or root burn.

4

If plants in the disinfected zone look the same as those in the non-disinfected zone, it is safe to plant.
